

Immune response

*A two-player tactical board game
of infection and immune system in the body*

v1.2

1. INTRODUCTION

A dangerous infection threatens the human body. The immune system mobilizes to stop it. In this two-player board game, one player takes the role of the **infection**, and the other becomes the **immune system**. Through area control and DNA chain construction, players vie for dominance over key organs in the body (Heart, Lungs and Liver).

2. OBJECTIVE

There are three ways to win the game by dominance over key organs:

- **Control all three organs** simultaneously at the end of the round.
- **Control two organs** at the end of the round **with at least four collected DNA cards**.
- **Win again on an organ you already control** to win the game instantly.

3. COMPONENTS

- 1 Game board featuring 3 organ play areas (**A**) and a Protein Action Rondel (**B**)
- 2 sets of player markers (20 red for Immune System (**C**), 20 green for Infection (**D**))
- 6 custom action dice (**E**)
- 28 DNA fragment tiles (**F**), two sided
- 16 DNA cards (with bonus effects and build patterns) (**G**)

4. SETUP

1. **Assign Roles:** One player is the Immune System (red markers), the other is the Infection (green markers).

2. **Initial Marker Placement on Organs (A):**

- Place a red marker on the **center space** of both the Liver and Heart.
- Place a green marker on the **center space** of the Lungs.
- The other player then places one marker **on any space adjacent** to the center on each organ they did not start on.

3. **Prepare DNA Elements (G, F):**

- Shuffle the DNA cards and reveal 4 face-up to form the available DNA pool.
- Place the DNA fragment tiles in a common supply next to the board.

4. **Set Protein Action Rondel (B):**

- Each player places a marker "Remove marker from board" action space of the **shared Protein Action Rondel**.

5. **The infection (green) starts the first round**

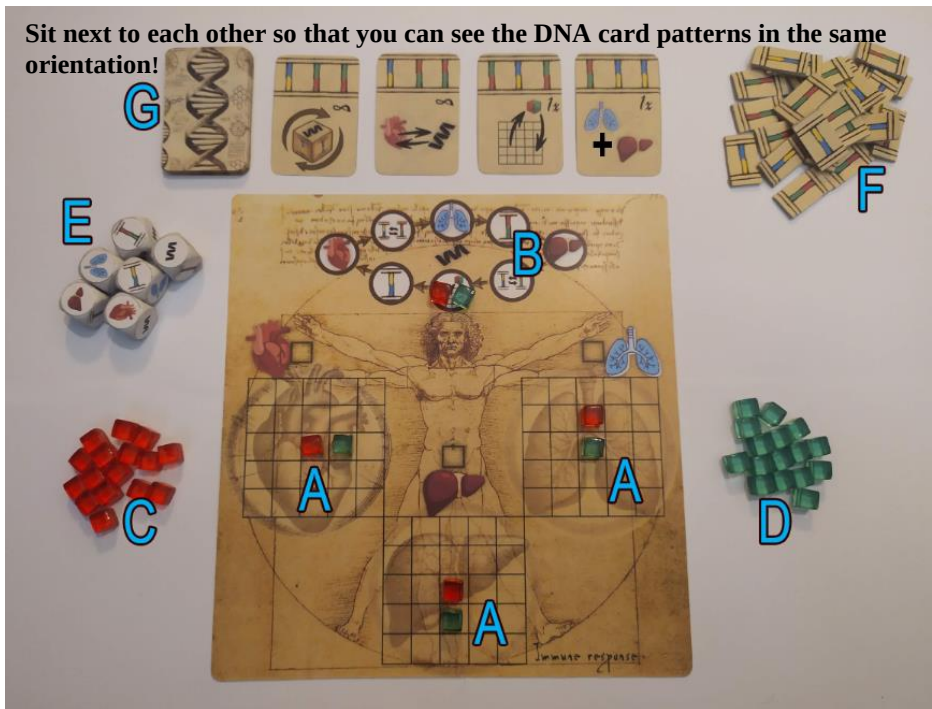

Figure 1: Game setup and components

5. GAMEPLAY OVERVIEW

Each round proceeds as follows:

1. The starting player rolls all 6 dice, then splits the dice into **two groups** of three dice.
2. The opponent chooses one group and keeps those dice, leaving the other three to the starting player.
3. Starting with the roller, players take turns using **one die at a time** (alternating turns), until all 6 dice are used. Used dice are placed back in the center to distinguish the remaining actions.
4. The role of starting player switches at the end of the round.

6. DICE ACTIONS

Each side of a die corresponds to a specific **action** the player must take.

Dice action: Place Marker on an Organ

- Place one of your markers on the specified organ.
- Try to surround opposing markers entirely with your color and/or the edge of the organ play area.

Surrounding Rule:

- To capture a group of opposing markers, they must be completely surrounded on all four orthogonal sides.
- You may not place into a space that would result in your own marker(s) being surrounded unless it also surrounds opposing markers winning control over the organ.

Lives of a marker group:

A marker group can consist of one or more markers of the same color touching perpendicularly. The group has as many lives as free spaces are next to it. Expanding a group can increase its lives.

Capturing:

- If you successfully surround the opponent group, remove all markers from that organ play area and create a new setup with the winner color in the center and the other color next to it.
- Place one of your markers on the box next to the **organ icon above the play area** as control marker.
- A new battle begins on the organ. If control changes later, update the control marker accordingly.
- If a player already controlling an organ wins in that organ again, they immediately win the game.
- If player markers run out, marker with one of the most lives from the same organ can be moved instead of placing a new one.

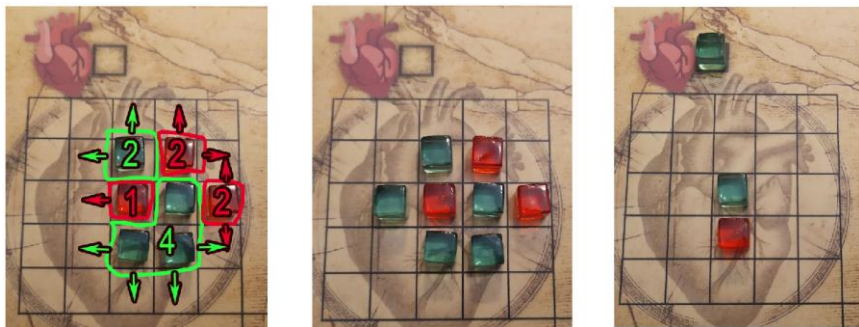

Figure 2: Group lives and capturing

Three red groups have 2-2-1 lives (free adjacent spaces), The two green groups have 2 and 4 lives. Green captures the red group with 1 life winning the Heart. Green marker is placed on the Heart control indicator square and a new match is set up.

Dice action: Build DNA Chain

- Both player builds their own DNA chains from fragment tiles.
- Attach a DNA fragment of the indicated color to either end of your DNA chain.
- You may rotate the new tile in any orientation but keep the color face of the tile corresponding to the die action.

Claiming DNA Cards:

- When your DNA chain contains a pattern matching a DNA card, you may claim it on your turn before or after your dice action.
- Place the DNA card over the matching section and perform the instant effect. The covered DNA fragments are now locked.
- Refill the available DNA cards from the deck.
- You may delay claiming a card until the optimal moment.

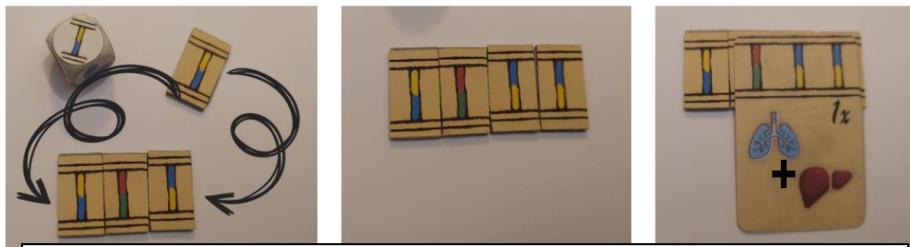

Figure 3: Building DNA chain and claiming DNA card

Dice action: Protein Action

- Move your protein marker up to **3 free spaces clockwise** on the shared Protein Rondel.
- Choose the action space you land on and perform that action.
- You may not move onto a space currently occupied by the other player's marker.
- Protein Rondel actions include:

- Organ and DNA chain actions familiar from the dice,
- Remove a marker of either color from an organ (only if not the only marker of its color on that organ)
- Rotate a DNA fragment in place already placed in your DNA chain or relocate it to any place in the uncovered parts of the chain without rotation.

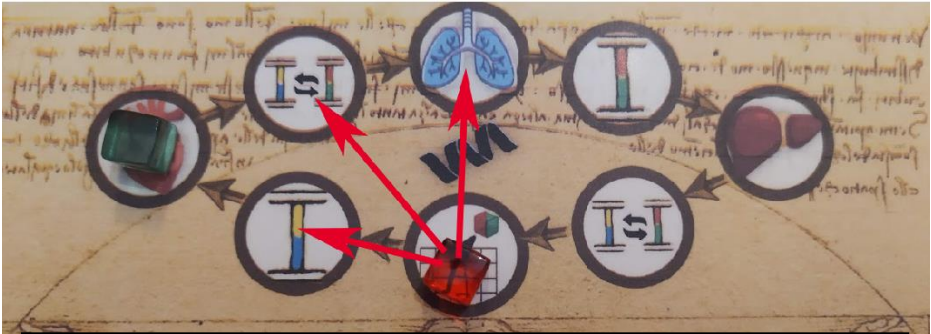

Figure 4: Available next three Protein Rondel actions for red

7. DNA CARDS

There are two types of DNA card effects: *Instant Effect* and *Ongoing Bonus Capability* cards.

Instant Effects (triggered 1x when claimed):

- Place a marker on both of the two specified organs
- Perform 2 protein actions consecutively
- Place one marker of either color on any organ
- Remove one marker of either color from any organ (except if it's the only one of its color)
- Move any marker to another empty space inside the same organ

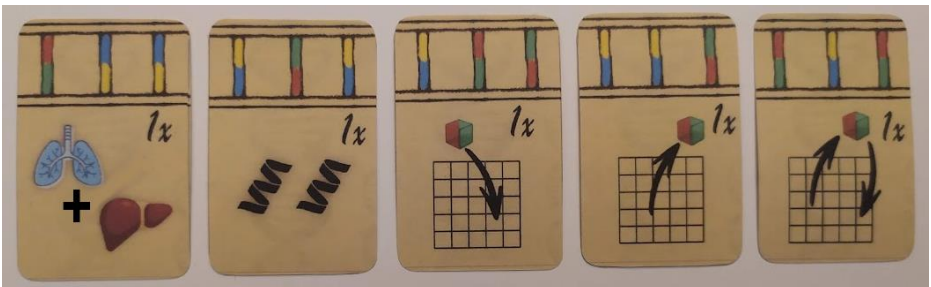

Figure 5: Instant Effect DNA cards

Ongoing Bonus Capabilities:

- Use one die of either a protein or specific organ die as the other action
- Re-roll a die once at either before or after dice group selection, if the original face matches one of the three shown on the card. (The rolling players can reroll corresponding die from the six before grouping them, or reroll from the three they are left with. The second players can reroll from their 3 selected dice the one matching the face from the card)

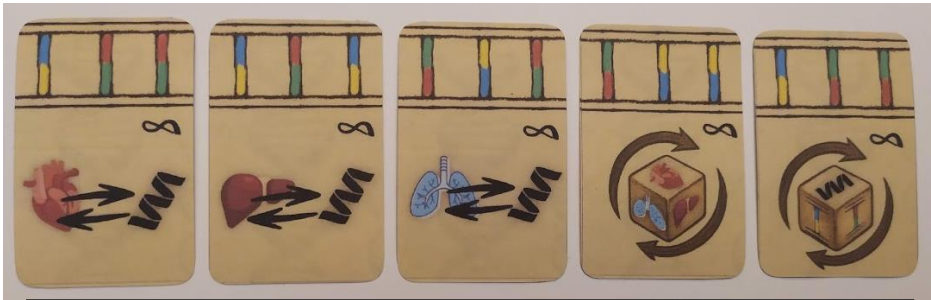

Figure 6: Ongoing Bonus Capability DNA cards

8. END OF GAME

The game ends if one of the following winning conditions are fulfilled:

- **One player controls all three organs** simultaneously at the end of the round.
- **One player controls two organs** at the end of the round **with at least four collected DNA cards**.
- **Win again on an organ you already control** and win the game instantly.
